# Assessing effects of mixtures of Per- and Polyfluoroalkyl Substances (PFAS) using transcriptomic points of departure

Gregory Addicks DSRG presentation - March 7<sup>th</sup> 2023

# Overview

- Introduction
  - PFAS chemicals and why mixtures are a concern
- Main Question
  - Do PFAS have synergistic or antagonistic effects or are their effects additive?
- Methodology
  - Chemicals and mixtures Cells and treatments Sequencing and QC
  - Data processing and BMC generation with BMD Express
  - Using data to predict mixture potency
- Results
  - Comparison of predicted mixture potency to empirical mixture potency

# The Miracle of PFAS

PFAS are Per and Polyfluoroakyl Substances

- Hydrophobic
- Lipophobic
- Heat and Fireproof
- Non-stick
- Very low surface tension
  - Helps stuff flow and/or stick
- Breathable waterproof fabrics
- Non-stick cookware
- Waxed paper
- Waterproof makeup
- Stain guard
- Fire fighting foam
- Industrial processes

# The Problem with PFAS

PFAS are Per and Polyfluoroakyl Substances

- Hydrophobic
- Lipophobic
- Heat and Fireproof
- Non-stick
- Very low surface tension
  - Helps stuff flow and/or stick
- Do not break down in environment
- Mobile in the environment
- Accumulate in biological organisms
- Resemble metabolic substrates
- Interact with cellular metabolism regulators
- Associated with numerous health problems

# The PFAS Problem

### Project Overview - Assess PFAS mixtures

- Assess potency of PFAS mixtures
  - PFAS are in the environment
     – exposure to multiple PFAS is supported by biological screening surveys worldwide
  - Do PFAS mixtures have additive, synergistic or antagonistic effects?
- Human Liver Spheroids exposed to PFAS and PFAS mixtures
- Transcriptomic analysis of overall change to gene expression
- In-vitro
  - Exposures are most relevant to concentrations at plasma / cellular level
    - Data is not directly usable for regulatory purposes
    - Exposures need in-vitro to in-vivo extrapolation

# PFAS used in this study

Class	Name (Acronym)	Structure	Class	Name (Acronym)	Structure

### **PFAS** Mixtures

- 14 PFAS used in study
- 7 mixtures of varying complexity and composition
- Mixture concentration range similar to PFAS
  - Exposure concentration for mixtures =
    - Combined concentration of all PFAS
    - $2\mu M$  Mixture =  $1\mu M$  POFA +  $1\mu M$  PFOS
  - Mixtures are all equimolar
    - External exposures are variable
    - Each component has opportunity to affect total mixture potency

#### Mixture components

PFAS exposed Human Liver Spheroids

- Contains cells from 10 donors
  - Donors from both sexes
  - Kupffer cells and hepatocytes
- ~2000 cells per spheroid

### 3D InSight<sup>™</sup> Human Liver Microtissues

### 3D InSight<sup>™</sup> Human Liver Microtissues

PFAS exposed Human Liver Spheroids

- Contains cells from 10 donors
  - Donors from both sexes
  - Kupffer cells and hepatocytes
- ~2000 cells per spheroid
- One spheroid per exposure
  - One spheroid per well

### 3D InSight<sup>™</sup> Human Liver Microtissues

PFAS exposed Human Liver Spheroids

- Contains cells from 10 donors
  - Donors from both sexes
  - Kupffer cells and hepatocytes
- ~2000 cells per spheroid
- One spheroid per exposure
  - One spheroid per well
- 6 Exposure concentrations
- 4 Replicate exposures (1 x per plate)
- 2 Exposure times (24 hours and \*10 days)
  - \*Media refreshed every 48 hours

### 3D InSight<sup>™</sup> Human Liver Microtissues

PFAS exposed Human Liver Spheroids

- Contains cells from 10 donors
  - Donors from both sexes
  - Kupffer cells and hepatocytes
- ~2000 cells per spheroid
- One spheroid per exposure
  - One spheroid per well
- 6 Exposure concentrations
- 4 Replicate exposures (1 x per plate)
- 2 Exposure times (24 hours and \*10 days)
  - \*Media refreshed every 48 hours
- Several controls
  - DMSO
  - Downstream processing
    - Sequencing

• QC

### Transcriptomics

- TempO-Seq
  - Higher throughput
    - (less in house labor)
  - More economical
    - (lower cost for sequences)
- S1500+
  - 2753 genes
  - Captures all pathways
- Quality Control (QC)
  - spheroid loss
  - contamination
  - unexplained excessive variability

Gene expression measurement

- Transcriptomics
  - Measure cellular compensation response
  - Direct activation of transcription factors
  - Global and specific effects
- TempO-Seq
  - Oligo based gene expression
  - Assesses expression of specific genes
  - Higher number of genes than microarray
  - Sequencing screens out background
  - Higher throughput than RNA seq
- S1500+
  - 2753 genes
  - Representative of diverse biological space
  - More economical that whole transcriptome TempO-Seq

### PFAS Cytotoxicity

Sequencing data for cytotoxic samples removed from downstream data processing to improve statistical power for data quality control

<sup>24</sup> hours PFAS exposure cytotoxicity

### Quality Control (QC)

- Sequencing data was screened for several measures to ensure data quality
- **Clustering distance** •
- Number of mapped reads •
- Fraction of mapped reads •
- Number of active probes •
- Number of probes with 80% ٠ of signal
- Gini coefficient ۲

### 10 day PFAS exposures

PFAS concentration ( $\mu$ M)

- Data for each concentration used for bootstrapping
- Data for each gene, each exposure level and PFAS or mixture used to create a normal distribution

#### Mix1 Mix2 Mix4 Mix5 Mix3 Mix6 Mix7 3 -2 -**PFBA PFPeA PFHxA PFHpA PFOA PFNA** PFDA . . ... . . .... 4 -. . . . . . . . .... .... . .. .. ... 3 -2 -0.4 5 8:2 $\mathbf{\omega}$ 4 -3 -2 -1 -0 $\sim$ 10 100 4.1% 4.1% 0 0.1 /lix7 2.1% 2.1% 4 -3 -... 0.1% 0.1% 13.6 13.6% 0.0 2 -1 -•• $\mu - 2 \sigma_{HxA} \mu - \sigma$ $\mu_{\text{FP}} \mathcal{F}_{\text{FP}} \mathcal{F}_{\text{A}} \sigma$ $\mu + q_{FOA} \mu + 2\sigma \mu + 3\sigma$ PFHDA PFBA PFDA 4 3 -2 -1 -PFOS **PFUnA** PFBS **PFHxS** PFOSA FtS 6:2 FtS 8:2 3. 1 -10 100 100 0.7 7 70 0.7 0,7 100 Ö., 10 0,7 7 . 10 100 0,7 . 10 ion Ö, 10 100 10 100 7 7 7 7

PFAS concentration ( $\mu$ M)

- Data for each concentration used for bootstrapping
- Data for each gene, each exposure level and PFAS or mixture used to create a normal distribution
- Normal distributions are randomly sampled for each gene, exposure level and PFAS or mixture

#### Mix1 Mix4 Mix5 Mix2 Mix3 Mix6 Mix7 3 -2 -**PFBA PFPeA PFHxA PFHpA PFOA PFNA PFDA** . .... • • .... . . .... ....... . . . .. 0.4 S 8:2 $\mathbf{\omega}$ 0 0.2 10 100 34. % 34. % 0.1 /lix7 2.1% 2.1% 4 -0.1% 0.1% 13 ;% 13.6% 3 **-**0.0 2 -1 -... $\mu - 2 \sigma_{HxA} \mu - \sigma$ $\mu_{FPEA}$ $\mu + q_{FOA} \mu + 2\sigma$ <sub>µ</sub>µ<sub>NÅ</sub>3σ PFHDA PFBA PFDA 3 -2. **PFUnA** PFBS PFHxS PFOS PFOSA FtS 6:2 FtS 8:2 100 100 10 100 10 0.7 Ö., Ö., Ö., Ö., 100 0,7 100 10 100 7 10 10 7 7 7 10 10 100

PFAS concentration ( $\mu$ M)

- Data for each concentration used for bootstrapping
- Data for normal distributions are randomly sampled for each gene
- Normal distributions are randomly sampled for each gene, exposure level and PFAS or mixture
- End result is:
- 100 x exposure series simulations (for each gene for each PFAS or mixture and exposure time)

### BMC Determination using BMDExpress – Gene Expression

- Gene expression data for each PFAS / Mixture exposure series
  - Filtered for 1.5 fold change in expression
  - Williams trend test p = 0.01
  - Plotted for dose response curve fitting
  - BMC is one standard deviation from the mean of the DMSO control

- All BMCs for each exposure series are placed in a bootstrap distribution
  - BMCs are sampled the appropriate number of times (depending on total number of <sup>4</sup>/<sub>2</sub> BMCs)
  - BMC list is ranked by BMC concentrations
  - Repeated 10,000x resulting in list of potential BMCs for each rank
    - Lowest BMC
    - 2<sup>nd</sup> lowest BMC...
    - 25<sup>th</sup> lowest BMC
- For each BMC rank: median 2.5% and 97.5% values used for BMCs and 95% CIs

BMC accumulation plots

- BMCs ranked from lowest concentration
  - 10s to 100s of BMCs for each PFAS
  - Total # of BMCs influenced by experimental parameters
    - Exposure concentrations
    - Cytotoxicity
- 25th BMC
  - Concerted molecular response
  - Concentration where gene expression changes broadly
    - Compensation to changes caused by toxicant exposure
    - Direct activation of transcription factors

25<sup>th</sup> BMC – does not require accurate highest BMC #

### **PFAS Potency**

- Longer chain PFAS generally more potent
- Different potency depending on type of PFAS
- Mixtures seem to have potency corresponding to their constituents

### **PFAS** Potency

- Longer chain PFAS generally more potent
- Different potency depending on type of PFAS
- Mixtures seem to have potency corresponding to their constituents

#### Mix1-Mix2-Mix3-Mix4-Mix5-Mix6-Mix7-**PFBA** PFPeA<sup>·</sup> **PFHxA** S Ę **PFHpA** PFOA **PFNA** PFDA-**PFUnA** PFBS **PFHxS** PFOS-PFOSA-FtS 6-2-FtS 8-2-Mixture

Are mixture potencies comparable to expectation based on single PFAS potencies?

# Analysis of Mixtures – Potency and BMC

- Chemicals having different relative potencies have stronger effects at the same dose
- BMCs are the doses of substances that result in the same specified effect
- BMC is reciprocal of Potency

\*example only – Dr. Addicks is not a physician or veterinarian

# Concentration addition (aka dose addition)

### Predicted mixture BMC calculations - based on dose addition

Fraction<sub>i</sub> = Fraction of each component in mixture BMC<sub>i</sub> = BMC of each component in mixture

$$BMC_{mix} = \left(\Sigma\frac{0.5}{2} + \frac{0.5}{4}\right)^{-1} = \left(\Sigma\frac{1}{4} + \frac{1}{8}\right)^{-1} = \frac{3}{8}^{-1} = \frac{8}{3} = 2.67$$

# BMC (mixture) of POFA and PFOS =

Predicted BMC (mixture) =

ure) = 
$$\left(\frac{0.5}{16.14} + \frac{0.5}{1.92}\right)^{-1}$$
 = (0.0295 + 0.260)<sup>-1</sup> = (0.290)<sup>-1</sup> =

# BMC (mixture) of POFA and PFOS = 3.45

Predicted BMC (mixture) =  $\left(\frac{0.5}{16.14} + \frac{0.5}{1.92}\right)^{-1}$ 

 $+ \frac{0.5}{1.92} \Big)^{-1} = (0.0295 + 0.260)^{-1} = (0.290)^{-1} = 3.45 \,\mu\text{M}$ 

### 24 hour 25<sup>th</sup> gene BCMs (+/- BMCL/BMCU)

- **Concentration Addition** predicted BMCs
- Empirical O
- Predicted  $-\Delta$
- No clear deviation from additivity
- Most have overlapping CIs
- Most have less than ± 2 fold differences in BMC
- All have less than ± 2 fold differences in CI endpoints

#### Dose addition calculations done for each BMC independently (RPF calculated for each BMC)

## CA predicted PFAS mixture BMCs

## CA predicted PFAS mixture BMCs

# Conclusions

- PFAS mixtures have additive effects in mixtures
  - No evidence of synergistic or antagonistic effects using conservative criteria
  - Debate continues on what qualifies as synergistic or antagonistic
- Findings apply to PFAS concentrations at cellular environment
  - Relative potencies of PFAS differ from some in-vivo data
    - Bioaccumulation or excretion?
  - In-vitro to in-vivo extrapolation data needed to apply this data to human or animal external exposures through food, water, contact etc.
  - Can not exclude PFAS interactions affecting accumulation, persistence or excretion at whole organism level
